More Fun Stuff

- Raffle: Please join us in the Atrium at 5:15 PM for the raffle. We are raffling some exciting prizes (need to be present to win)!!!
- **SharePint** will be held at **Beerhead Bar** (110 Federal St, Pittsburgh, PA 15212). While it starts at 5:45 PM, there's no end time!!!! 😊😊😊 
- Pittsburgh Area SharePoint User Group
 - Meets at the Microsoft office on the North Shore
 - More Info: <https://www.linkedin.com/groups/Pittsburgh-Area-SharePoint-User-Group-3769745/about>

We do Request that...

- You fill out the Session Evals. These will also be your Raffle tickets. Print your name clearly if you intend to participate in the Raffle and drop the forms at the registration desk after the last session.
- You visit the sponsors. The event is possible due to their generous support and we request that you visit them and inquire about their products & services.
- Cell phones be kept on silent as a courtesy to other attendees and speakers

Our Agenda

- SharePoint Online (SPO) Implementation
- Acknowledging the Reality of Plumbing
- SharePoint Online Diagnostics and Tools
- Design and Development Guidance
- Samples and Examples
- Questions and Answers Throughout!
- References

But first ...

An important note

This is
Office 365

changing and updating it"

Please don

**Office 365 is an
"evergreen service"**

meaning "Microsoft is always changing and updating"

**Office 365 is an
"evergreen service"**

meaning "Microsoft is always changing and updating it"

What I show you today ...

- will probably be true tomorrow

always changing and updating

What I show you today ...

- will probably be true tomorrow
- has a good chance of being true next week
- might be true in month
- probably worth questioning and re-evaluating in a year

Please don't dig this up in five years and then send me hate mail because I presented something that is no longer accurate due to a SharePoint Online service change.

Please don't dig this up in five years and then send me hate mail because I presented something that is no longer accurate due to a SharePoint Online service change.

Dear Sean,

I was reviewing a presentation you put together five years ago, and I found elements that were incorrect. You are a horrible person and you should never touch SharePoint Online again.

Love you lots!
- an attendee

First Stop:

Some basic
SharePoint farm
architecture

(and why
that matters
with SPO)

Welcome to the farm!

might think that SPO is simply an extension of this pattern

On-premises SharePoint farms come in all shapes and sizes

Small Farm

<1,000 users

Fault tolerance for simple workloads with small volumes of content

Two tiers:

- Combined front-end and batch processing servers
- Database servers

Scale the number of servers as needed.

Medium Farm

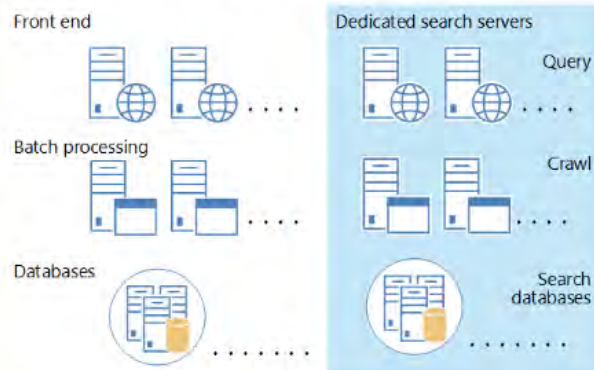

<10,000 users

Dedicated search servers for up to 10 million items.

Three tiers:

- Front-end servers
- Batch processing servers
- Database servers

Scale the number of servers as needed.

Large Farm

More than 10,000 users

Additional server types to support large farms.

This farm represents each of the server roles that are recommended. For each server role the servers are configured identically. Scale each server role independently. Large farms benefit by adding dedicated servers for Distributed Cache and by adding Request Management.

Databases

.....

Search databases

Adding and removing is not an instantaneous process, though.

If you can control load (for example, gradually increasing the number of invited users over time when you roll out a site), you should. It will give the provisioning system time to adjust/compensate for growing load.

If you remember only one thing in this discussion of stamps and elastic capacity, please let it be this one point ...

Load
testing
is futile.

astic nature of a stamp, there's really no way to effectively load t

g the number of
uld. It will give
growing load.

please let it be this one point!!!

Load testing is futile.

- Given the elastic nature of a stamp, there's really no way to effectively load test SPO. Any numbers you get or produce are essentially meaningless in the grand scheme of things.
- Rather than load testing, focus instead on the items we're going to cover in the rest of this presentation. They'll help you avoid poorly performing pages and sites.

Welcome to the farm!

The Reality of Plumbing

Connected to SharePoint Online to make it easier for you to find information and a full address book.

The Reality of Plumbing

The Network

The Network

If we're talking about end-to-end performance, we really need to start with the plumbing that carries everything.

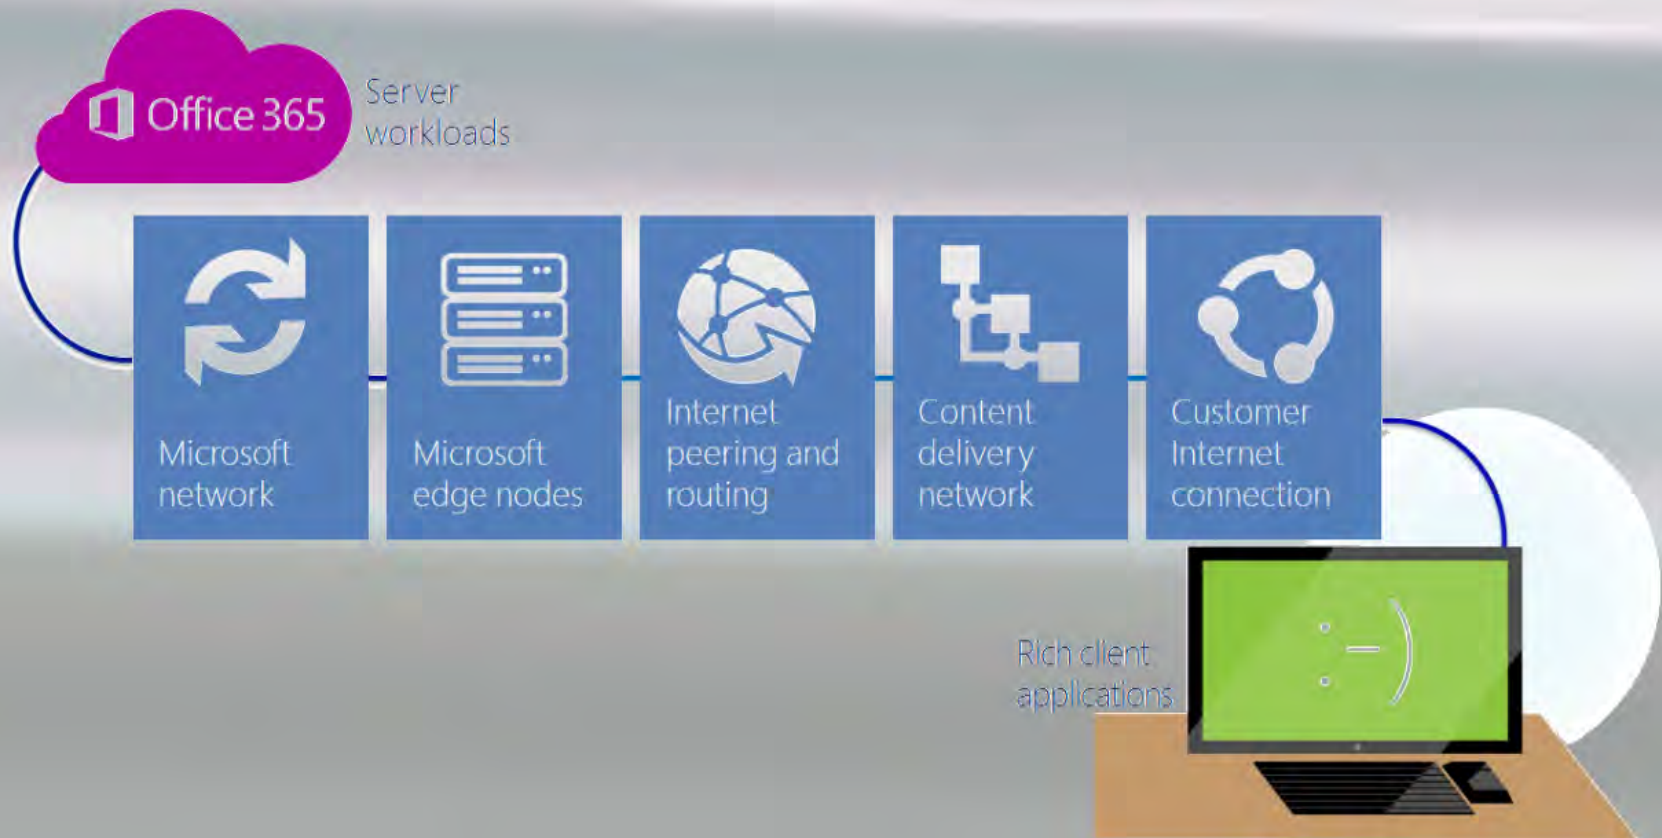

Although it's easy to abstractly refer to the transport layer as "the network" ...

... the reality is that there's a lot of routing, traversal, and redirection between client workstations and SharePoint Online.

If the network is "out of whack,"
it can look like SharePoint
Online itself is the issue.

Connecting to SharePoint Online involves a lot more than just your browser and a cloud-based server.

We don't have time to cover all the plumbing in this session ...

So, remember this

If you've spent a lot of time

We don't have time to cover all the plumbing in this session ...

So, remember this:

If you've spent a lot of time troubleshooting in SharePoint Online (to little or no effect), maybe you should zoom out and consider the network.

Okay, so it really feels like there is a tangible performance problem.

Okay, so it really feels like there is a tangible performance problem.

How do you prove it objectively?

The good news: the destruction of computer equipment is not necessary (although you might feel compelled to do so)!

objectively?

Meet your primary
diagnostic tool.

Meet your primary
diagnostic tool.

In all likelihood, you already
have it on your system.

Hello,
Edge!

like

Um ...
you're
kidding,
right?

None!

Um ...
you're
kidding,
right?

Nope!

You are now in the cloud!

As obvious as that sounds, I continually see

acknowledgement:

You are now in the cloud!

As obvious as that sounds, I continually see SharePoint developers and those customizing sites act as if SharePoint Online were no different than their on-premises SharePoint environments.

very important
acknowledgement:

You are now in the cloud!

As obvious as that sounds, I continually see SharePoint developers and those customizing sites act as if SharePoint Online were no different than their on-premises SharePoint environments.

Let's compare:

On-Premises	 SPO
High Bandwidth	Low(er) Bandwidth
Low Latency	High(er) Latency

Failing to acknowledge the "we're in the cloud now" reality leads to a problem I simply call ...

Too Many

Failing to acknowledge the "we're in the cloud now" reality leads to a problem I simply call ...

Too Many,
Too Big

- Too many calls are made to the server.

now" reality leads to a problem I simply call ...

Too Many, Too Big

- Too many calls are made to the server.
- Too many files are referenced on pages.
- The files in-use are too large.

Consider one or more of the following:

- Minify files, especially JavaScript files.

• Resize images to usage sizes

Consider one or more of the following:

- Minify files, especially JavaScript files.
- Resize images to usage sizes.
- Compress images (more) aggressively.
- Use sprite sheets to reduce the actual number of HTTP requests needed to retrieve images.
- Use SharePoint's Image Rendition service.
- Leverage a toolkit like Font Awesome in place of individual icons and associated files.

And the big
kahuna ...

Use a CDN!!!

(Content Delivery Network)

No CDN in use (i.e., SPO library direct)

Path to Better Performance

Conventional wisdom
says caching is good.

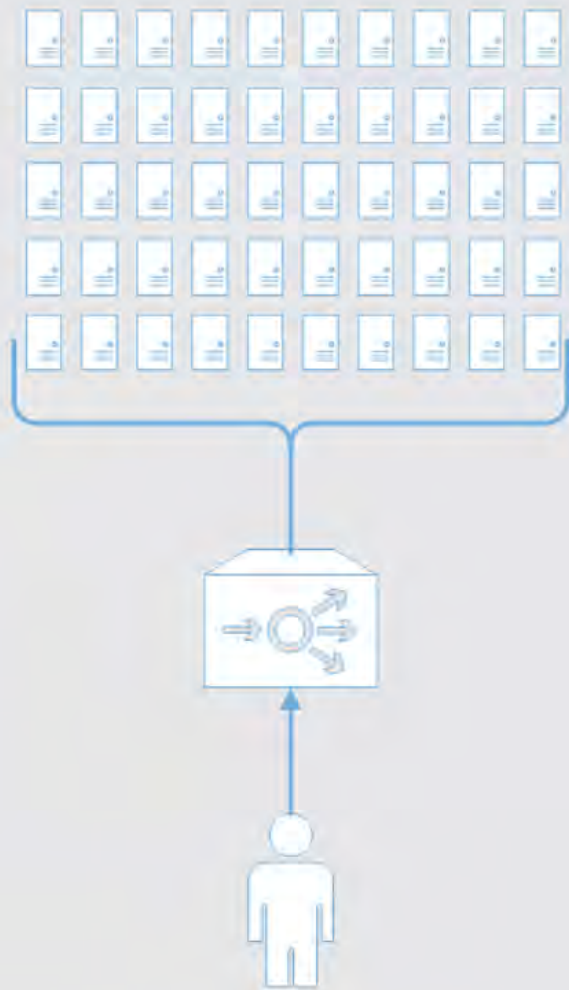

says caching is good.

After just a few requests, the on-premises Object Cache can be "ready for action."

In the cloud, the caching equation (for per-server memory-based caches like the Object Cache) works out a bit differently.

User's Initial Request

- First thing to note: the number of WFEs tends to be *much* higher in the cloud versus on-premises.

User's Second Request

User's Second Request

- No affinity is in use, so the chance of a user hitting the same server again is dramatically less than the on-premises scenario.

Subsequent Requests

- Same reduced chance of hitting the WFE last visited
- Memory pressure causes much more frequent cache ejections versus on-premises.

Two significant adjustments can be made.

* These sitemaps are then stored in the Object

Navigation style
has a huge impact
on performance.

CHOOSE

Using structural navigation is the default (but poor) choice for complex site hierarchies in the cloud.

- * building each site node generates roughly 8 SQL Server round trips
- * These sitemaps are then stored in the Object Cache on WFEs

Navigation style
has a huge impact
on performance.

8 site nodes/~64 SQL calls

8 site nodes/~64 SQL calls

Better Options for Navigation

- Managed Navigation (i.e., using a term set to drive navigational structures) can significantly improve page performance.
note: the SharePoint Server Publishing Infrastructure site collection Feature must be enabled to use Managed Navigation
- Search-driven navigation leverages SharePoint's Search index and the process of client-side navigational rendering to dramatically speed things up.
note: implementation is non-trivial and less customizable

Using structural navigation is the default (but poor) choice for complex site hierarchies in the cloud.

- * building each site node generates roughly 8 SQL Server round trips
- * These sitemaps are then stored in the Object Cache on WFEs

Navigation style

As was pointed-out in the navigational scenario,
Search can be used to boost performance significantly.

In the cloud, the CQWP can cause some significant

ut in the navigational scenario,
ed to boost performance significantly.

Do you like the Content Query Web Part (CQWP)?

the CQWP can cause some significant performance hits.

As was pointed-out in the navigational scenario,
Search can be used to boost performance significantly.

Do you like the Content
Query Web Part (CQWP)?

In the cloud, the CQWP can cause some significant performance hits.

- The CQWP performs expensive cross-list and cross-site queries at run-time.
- The CQWP relies on the Object Cache to store results for acceptable performance.
- The Content Search Web Part (CSWP) provides options that are similar to the CQWP (and in a number of ways, more powerful) and uses Search so it's FAST!

Path to Better Performance

Okay, time for a serious question ...

Are you a
web part
junkie?

If so, it's
time to
talk rehab.

What's the alternative to freebasing web parts?

There's no single

What's the alternative to freebasing web parts?

**There's no single
(or simple) answer.**

Generally speaking, consider leveraging client-side code (JavaScript) and asynchronous techniques - both of which we'll discuss soon.

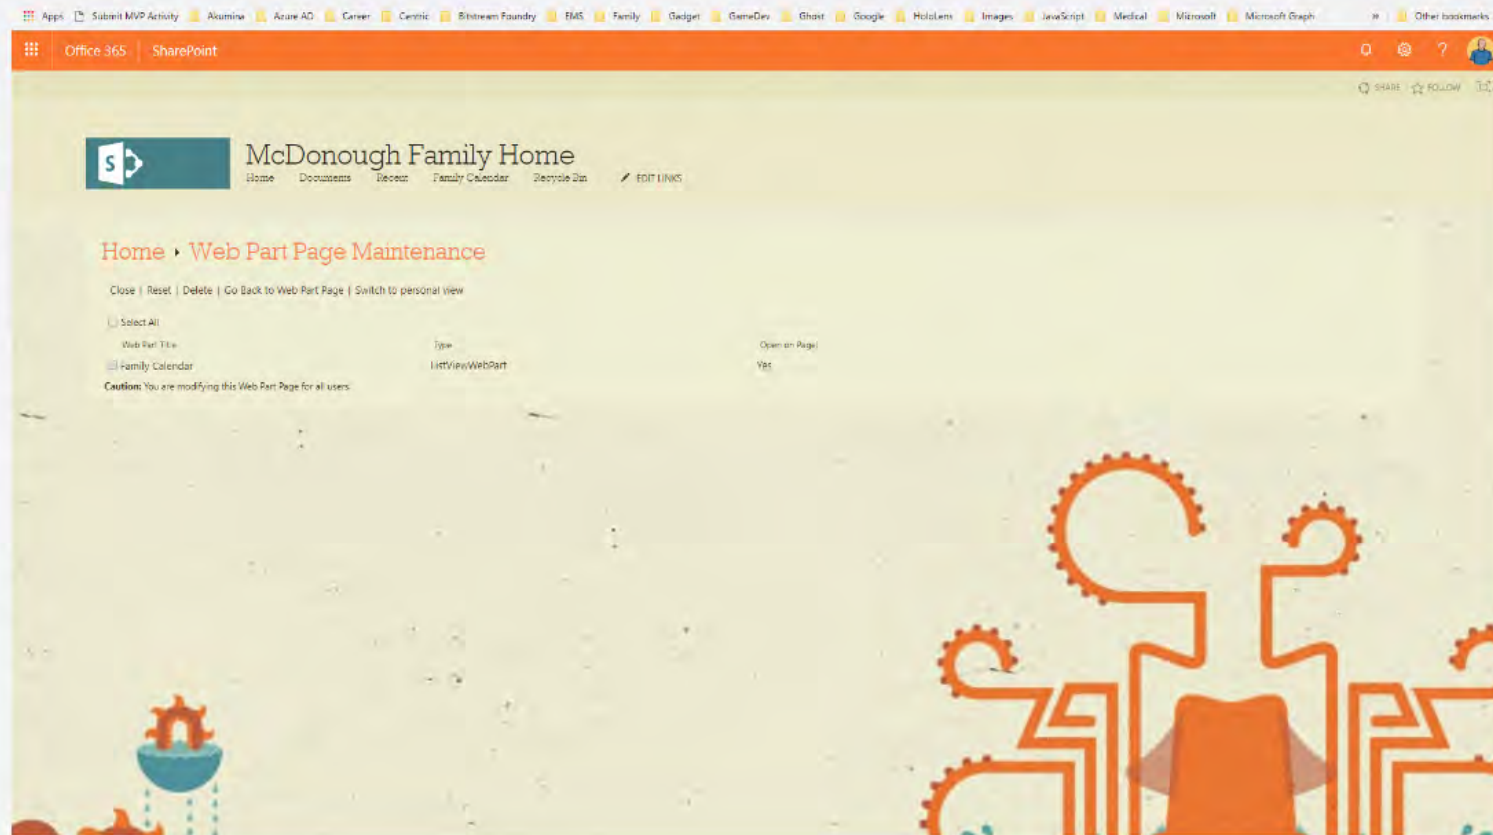

but ...

Be sure to put
problem pages

but ...

Be sure to put problem pages in web part maintenance view with **?contents=1** to find web parts which are closed but not deleted!

which are closed
but not deleted!

also note ...

When I say "web part," I'm talking about traditional (server-side) web parts. Everything is different, and all bets are off with SPFx/client-side web parts.

also note ...

Path to Better Performance

Path to Better Performance

Sometimes, perception is everything.

ALARM

A page may load quickly, but if it FEELS slow to users, it is the SAME AS BEING SLOW.

Sometimes, perception is everything.

ALARM

A page may load quickly, but if it **FEELS** slow to users, it is the **SAME AS BEING SLOW.**

Develop your asynchronous programming techniques

- You can't block a browser's main thread of execution, so leveraging async development patterns is essential.
- Async programming is made much easier in jQuery using promises. Promises approximate a synchronous programming model under asynchronous conditions.
- Certain web parts (e.g., the CSWP) also allow you to set their (a)sync behavior.
- Good use of async techniques make pages **appear** to load faster ... and as we discussed, perception is everything.

Speaking of asynchronous techniques:

Only load what you need.

- Instead of fetching everything at once within the context of the initial page load, retrieve the page with only the payload that's needed immediately.
- (Lazy) load images and other items "below the fold" only if users start scrolling down and will see them (e.g., Facebook and LinkedIn's "forever-scrolling" pages).

Path to Better Performance

Ask yourself this question:

How well do I
know the code
and libraries
I'm using?

Reason I ask: when troubleshooting performance issues, I commonly encounter a pattern that can be illustrated with the following diagram of stages:

I'm using?

be illustrated with the following diagram of stages:

"Alright,
within m

*
Stage 1:

"I have a problem to solve. I wonder if anyone has written this code before?"

*
Stage 2:

"Hey, there's a JavaScript library for this. I wonder if it'll work for my project?"

Stage 3:

"Alright, the demo code works within my project scaffolding!"

Stage 4:

"I understand the library internals or how it works at least well enough to know that it won't cause me any problems with SPO."

I'm using?

be illustrated with the following diagram of stages:

Stage 3.2...ish:

"The demo code worked, and I tweaked it to do what I needed it to do. I'm not sure exactly *how* it works, but hey - it's working. Time to move on to something else ..."

hard
stop

Stage 3:

I'm using?

be illustrated with the following diagram of stages:

example

How many of you

example

How many of you know who this man is?

Chances are at least one or two of you have used code that he has created to get things done in your client-side development projects ...

Before CSOM/JSOM and REST
Marc's library simplified access
for developers everywhere. It

Marc D. Anderson

- **creator of SPServices**
- master of client-side development and associated techniques

Before CSOM/JSOM and REST APIs - and before WCF SVC endpoints - Marc's library simplified access to the older ASMX web service endpoints for developers everywhere. It's still used heavily today.

So, getting back to "know your code/libraries" and how they work ...

As Marc will tell you, SPServices works just

So, getting back to "know your code/libraries" and how they work ...

As Marc will tell you, SPServices works just fine with SharePoint Online. But even Marc will tell you that you probably shouldn't use all of SPServices' methods when accessing SPO.

```
1 //Pre-populate all "Contact" fields with current user
2 var thisUserName = $().SPServices.SPGetCurrentUser({
3     fieldName: "Title",
4     debug: false
5 });
6 $().SPServices.SPFindPeoplePicker({
7     peoplePickerDisplayName: "Contact",
8     valueToSet: thisUserName,
9     checkNames: true
10 });
11 $().SPServices.SPFindPeoplePicker({
12     peoplePickerDisplayName: "Author/Contact",
13     valueToSet: thisUserName,
14     checkNames: true
15 });
16 $().SPServices.SPFindPeoplePicker({
17     peoplePickerDisplayName: "Organizer/Contact",
18     valueToSet: thisUserName,
19     checkNames: true
20 });
```

Consider
this code.

It works just
fine and does
exactly what
the comment
indicates.

**But it has a
big problem.**

Anyone ever used the SPServices.SPGetCurrentUser() method

```
1 //Pre-populate all "Contact" fields with current user
2 var thisUserName = $().SPServices.SPGetCurrentUser({
3     fieldName: "Title",
4     debug: false
5 });
6 $().SPServices.SPFindPeoplePicker({
7     peoplePickerDisplayName: "Contact",
8     valueToSet: thisUserName,
9     checkNames: true
10 });
11 $().SPServices.SPFindPeoplePicker({
12     peoplePickerDisplayName: "Author/Contact",
13     valueToSet: thisUserName,
14     checkNames: true
15 });
16 $().SPServices.SPFindPeoplePicker({
17     peoplePickerDisplayName: "Organizer/Contact",
18     valueToSet: thisUserName,
19     checkNames: true
20 });
```

Consider
this code.

It works just
fine and does
exactly what
the comment
indicates.

**But it has a
big problem.**

Has anyone ever used the SPServices.SPGetCurrentUser() method?

Switching over to REST-based calls

WANTED: MARC ANDERSON

- Under the hood, `SPGetCurrentUser()` is generating an additional call to `/_layouts/userdisp.aspx` to “scrape” the contents of the page that is returned.
- If you (innocently) use `SPGetCurrentUser()` in your JavaScript files (especially multiple times in the context of a single page), you're creating all sorts of additional load on SPO and delaying the final results of your executing scripts.

Switching over to REST-based calls to get current user information can dramatically reduce execution time.

We had a script where `SPGetCurrentUser()` was being called several times. The results from swapping-in REST-based calls for the `SPGetCurrentUser()` calls:

I also performed some basic tests to capture the speed differences. I performed each test 10 times and here are the results:

- * Without the fix or browser caching - avg. 14.47 seconds
- * With the fix without browser caching - avg. 7.17 seconds
- * With the fix and browser caching - avg. 5.84 seconds

Big thanks to Scott Stewart and his team at Microsoft!

Path to Better Performance

The Quick Summary

- Don't treat SPO like your on-premises SharePoint farm. The two operate differently.
- Server-based caching isn't your friend (generally speaking) in SPO.
- Your browser can be your best friend when trying to troubleshoot SPO performance issues.
- Know the code you implement - or at least profile it before release.
